SAMPLE DELIVERABLE

IT Infrastructure Assessment

Executive Summary & Prioritized Improvement Roadmap

Important: illustrative sample only

This document demonstrates the structure, level of detail and management-oriented output that may be used in an IT assessment. The organization, environment, observations and risks below are fictional and are not based on a real client.

Illustrative business profile

Organization	Fictional Lebanese SME
Size	Approx. 60 users, one primary office and remote access
Technology profile	Microsoft 365, Windows endpoints, on-premises server workloads, business applications, firewall/VPN and third-party IT vendors
Assessment scope	Infrastructure, Microsoft 365, network/security, backup/recovery, operational ownership and continuity
Assessment objective	Identify practical risks, clarify priorities and provide a phased management roadmap

Assessment approach

- Review current-state technology, controls, dependencies and operating practices.
- Validate major risks and identify where ownership or documentation is unclear.
- Prioritize recommendations according to business impact, urgency and implementation effort.
- Translate technical observations into an actionable 30/60/90-day management roadmap.

EXECUTIVE SUMMARY

Management view of the environment

The illustrative environment is operational, but several dependencies are insufficiently documented or tested. The highest-priority issues relate to privileged access, recovery assurance, aging infrastructure and unclear ownership across multiple providers. The recommended approach is to address immediate control gaps first, then stabilize documentation, lifecycle planning and recurring operational governance.

Illustrative risk counts shown above are part of this fictional scenario and are included only to demonstrate how findings can be summarized for management.

Top management priorities

Priority	Risk	Why it matters	Recommended first action
1	Critical	Privileged Microsoft 365 access is not consistently protected by MFA.	Enforce MFA for all privileged identities and review admin role assignments.
2	Critical	Backup jobs exist, but successful recovery has not been recently demonstrated.	Perform an evidence-based restore test and document recovery ownership.
3	High	Core server platform is approaching end-of-support / lifecycle limits.	Confirm dependencies and create a modernization or migration plan.
4	High	Firewall/VPN rules and third-party access are not fully documented.	Review access paths, remove obsolete rules and establish an approved rule register.
5	High	Technology ownership is spread across vendors with no single operating register.	Create an IT responsibility matrix, asset register and recurring review cadence.

Management implication

The immediate objective is not a large transformation program. It is to reduce preventable operational risk, prove recoverability, clarify ownership and create a controlled modernization path.

DETAILED FINDINGS

Infrastructure & Microsoft 365

ID	Risk	Area	Observation	Recommended action
INF-01	High	Server lifecycle & capacity	One primary server workload is approaching lifecycle limits. Dependency mapping is incomplete, making replacement planning harder.	Document application dependencies, support status, capacity and migration options before committing to hardware or cloud changes.
INF-02	Medium	Asset & configuration documentation	Infrastructure inventory exists in fragments across spreadsheets, vendor emails and device interfaces.	Create a single controlled asset/configuration register with owners, warranty/support dates and critical dependencies.
M365-01	Critical	Privileged access protection	Administrative identities are not consistently protected with MFA and role separation.	Enforce MFA for all privileged users, reduce standing Global Administrator access and establish emergency access procedures.
M365-02	Medium	User lifecycle & access review	Joiner/mover/leaver steps are not documented end-to-end across Microsoft 365 and business systems.	Define a standard lifecycle checklist owned jointly by management/HR and IT.
M365-03	Medium	Licensing & security baseline	Licensing decisions are operationally driven, but there is no periodic review against security and collaboration requirements.	Review licenses, MFA coverage, sharing settings, mailbox/OneDrive retention and security baselines on a scheduled basis.

What good looks like

- A current asset/configuration register with ownership and lifecycle information.
- Privileged identities protected by MFA, least privilege and documented emergency access.
- A repeatable user lifecycle process covering Microsoft 365 and key business applications.
- Infrastructure modernization decisions based on business dependencies, recoverability and supportability - not technology fashion.

DETAILED FINDINGS

Network, Security & Recovery

ID	Risk	Area	Observation	Recommended action
NET-01	High	Firewall & VPN governance	Firewall rules, remote-access permissions and vendor access are not fully documented or periodically reviewed.	Build an approved rule/access register, validate business need and remove obsolete entries.
NET-02	Medium	Network segmentation	Business users, infrastructure and selected device classes have limited logical separation.	Assess VLAN/segmentation opportunities based on risk, device type and operational feasibility.
SEC-01	Medium	Endpoint security consistency	Endpoint protection is present, but policy coverage and exception handling are not consistently documented.	Confirm coverage, update/health status, exclusions, ownership and escalation procedures.
BKP-01	Critical	Recovery assurance	Backups are scheduled, but there is no recent documented restore evidence for critical workloads.	Perform representative file/system restores, record results and define recovery frequency and ownership.
BKP-02	High	Backup resilience	The backup design has limited separation from the production environment and recovery dependencies are not fully mapped.	Review off-site/immutable options, administrative separation, retention and recovery sequencing.
OPS-01	High	Vendor & operational ownership	Multiple providers support connectivity, Microsoft 365, security and business systems; accountability during incidents is unclear.	Create a responsibility matrix, contact/escalation register and recurring service review process.
OPS-02	Low	Operational documentation	Several routine procedures depend on individual knowledge.	Document high-impact procedures first: onboarding/offboarding, backup checks, vendor escalation and major system restart/recovery steps.

Continuity principle

A backup job that reports success is not the same as a demonstrated recovery capability. Management should have evidence that critical information and systems can be restored, who performs the recovery and what dependencies must be available first.

PRIORITIZED IMPROVEMENT PLAN

Recommended actions by horizon

Horizon	Risk	Action	Completion evidence	Suggested owner
0-30 days	Critical	Protect privileged access	MFA on all privileged identities; admin-role review; emergency access documented.	IT / Management
0-30 days		Prove recoverability	Run representative restore tests; capture evidence, RTO assumptions and recovery owners.	IT / Backup Provider
0-30 days	High	Clarify ownership	Create vendor escalation register and responsibility matrix for infrastructure, M365, network, backup and business systems.	Management / IT
0-30 days		Control firewall/VPN access	Review remote access, obsolete rules, third-party permissions and documentation.	IT / Security Provider
31-60 days		Plan infrastructure lifecycle	Map dependencies, support status and modernization options; prepare budgetary decision points.	IT / Management
31-60 days	Medium	Consolidate documentation	Build asset/configuration register and standard operational procedures.	IT
31-60 days		Improve user lifecycle	Formalize joiner/mover/leaver controls across M365 and core applications.	HR / IT
61-90 days		Review segmentation & endpoint controls	Validate VLAN/segmentation opportunities and endpoint policy coverage.	IT / Network Provider
61-90 days		Establish recurring governance	Monthly operational review; quarterly security/continuity review; annual lifecycle/budget planning.	Management / IT

Prioritization method

Recommendations are prioritized using a practical combination of business impact, security/continuity exposure, urgency, implementation dependency and effort. A real assessment would validate each item with management and adjust the roadmap to budget, operational timing and existing vendor commitments.

From assessment to controlled improvement

First 30 Days	Days 31-60	Days 61-90
• Protect admin access • Test critical recovery • Document vendor/escalation ownership • Review firewall and remote access	• Complete asset/config register • Confirm infrastructure lifecycle path • Formalize joiner/mover/leaver process • Close urgent documentation gaps	• Review segmentation and endpoint controls • Establish recurring management reviews • Finalize modernization priorities and budget inputs • Schedule continuity/security retesting

Typical assessment deliverables

- Executive summary for owners/management.
- Prioritized risk and observation register.
- Detailed technical findings with practical recommendations.
- 30/60/90-day action roadmap with suggested ownership.
- Supporting inventory, diagrams or control checklists where they add decision value.
- Management handover discussion to confirm priorities, dependencies and next actions.

How this sample should be used

This document is intentionally generic and fictional. A real engagement would be based on interviews, configuration review, available evidence, vendor information and direct observation of the client environment. Findings would be limited to what was actually verified, with assumptions and evidence gaps stated clearly.

Next step

An IT assessment can be used as a low-commitment starting point before a project, an ongoing IT management engagement or fractional IT leadership. The goal is to create clarity before committing budget or changing technology.
